RAPSIm (Renewable Alternative Powersystems Simulation) is a free and open source micro-grid simulation framework for better understanding of power flowing behavior in smart microgrids with renewable sources.

What is a microgrid system?

1. Introduction Microgrids are systems for supplying power composed of distributed energy resources (DERs), examples of which include diesel generators, photovoltaic systems, wind turbines, and battery energy storage systems.

What is a solar microgrid?

The microgrid consists of a behind-the-meter (BTM) solar photovoltaic (PV) system, a battery energy storage system (BESS), a combined heat and power (CHP) generator, and standby diesel generators. We modeled this microgrid by leveraging the ETAP software and performed power system studies for both grid-connected and islanded modes of operation.

What is a microgrid controller & energy management system modeling?

Controller and energy management system modeling. Many microgrids receive power from sources both within the microgrid and outside the microgrid. The methods by which these microgrids are controlled vary widely and the visibility of behind-the-meter DER is often limited.

What is a microgrid design tool?

The MDT allows designers to model, analyze, and optimize the size and composition of new microgrids or modifications to existing systems. Technology management, cost, performance, reliability, and resilience metrics are all offered by the tool.

Why should a microgrid program focus on flexible and interoperable software?

The recommended focus on flexible and interoperable software will help promote agility in the microgrid program and stay at the forefront of modeling advanced control systems and their impact on planning and design. Education, technology transfer, and industry adoption.
